Better data quality with constraints

INTRODUCTION TO RELATIONAL DATABASES IN SQL

Timo GrossenbacherData Journalist

Integrity constraints

- 1. Attribute constraints, e.g. data types on columns (Chapter 2)
- 2. **Key constraints**, e.g. primary keys (Chapter 3)
- 3. Referential integrity constraints, enforced through foreign keys (Chapter 4)

Why constraints?

- Constraints give the data structure
- Constraints help with consistency, and thus data quality
- Data quality is a business advantage / data science prerequisite
- Enforcing is difficult, but PostgreSQL helps

Data types as attribute constraints

| Name | Aliases | Description |
|---------------------------|-----------------|-------------------------------------|
| bigint | int8 | signed eight-byte integer |
| bigserial | serial8 | autoincrementing eight-byte integer |
| bit [(n)] | | fixed-length bit string |
| bit varying [(n)] | varbit [(n)] | variable-length bit string |
| boolean | bool | logical Boolean (true/false) |
| box | | rectangular box on a plane |
| bytea | | binary data ("byte array") |
| character [(n)] | char [(n)] | fixed-length character string |
| character varying [(n)] | varchar [(n)] | variable-length character string |
| cidr | | IPv4 or IPv6 network address |

From the PostgreSQL documentation.

Dealing with data types (casting)

```
CREATE TABLE weather (
temperature integer,
wind_speed text);
SELECT temperature * wind_speed AS wind_chill
FROM weather;
operator does not exist: integer * text
HINT: No operator matches the given name and argument type(s).
You might need to add explicit type casts.
SELECT temperature * CAST(wind_speed AS integer) AS wind_chill
FROM weather;
```

Let's practice!

INTRODUCTION TO RELATIONAL DATABASES IN SQL

Working with data types

INTRODUCTION TO RELATIONAL DATABASES IN SQL

Timo GrossenbacherData Journalist

Working with data types

- Enforced on columns (i.e. attributes)
- Define the so-called "domain" of a column
- Define what operations are possible
- Enfore consistent storage of values

The most common types

- text : character strings of any length
- varchar [(x)]: a maximum of n characters
- char [(x)]: a fixed-length string of n characters
- boolean: can only take three states, e.g. TRUE, FALSE and NULL (unknown)

From the PostgreSQL documentation.

The most common types (cont'd.)

- date, time and timestamp: various formats for date and time calculations
- numeric: arbitrary precision numbers, e.g. 3.1457
- integer: whole numbers in the range of -2147483648 and +2147483647

From the **PostgreSQL documentation**.

Specifying types upon table creation

```
CREATE TABLE students (
    ssn integer,
    name varchar(64),
    dob date,
    average_grade numeric(3, 2), -- e.g. 5.54
    tuition_paid boolean
);
```

Alter types after table creation

-- Turns 5.54 into 6, not 5, before type conversion

```
ALTER TABLE students
ALTER COLUMN name
TYPE varchar(128);

ALTER TABLE students
ALTER COLUMN average_grade
TYPE integer
```

USING ROUND(average_grade);

Let's apply this!

INTRODUCTION TO RELATIONAL DATABASES IN SQL

The not-null and unique constraints

INTRODUCTION TO RELATIONAL DATABASES IN SQL

Timo GrossenbacherData Journalist

The not-null constraint

- Disallow NULL values in a certain column
- Must hold true for the current state
- Must hold true for any future state

What does NULL mean?

- unknown
- does not exist
- does not apply

•

What does NULL mean? An example

```
CREATE TABLE students (
   ssn integer not null,
   lastname varchar(64) not null,
   home_phone integer,
   office_phone integer
);
```

```
NULL != NULL
```

How to add or remove a not-null constraint

When creating a table...

```
CREATE TABLE students (
   ssn integer not null,
   lastname varchar(64) not null,
   home_phone integer,
   office_phone integer
);
```

After the table has been created...

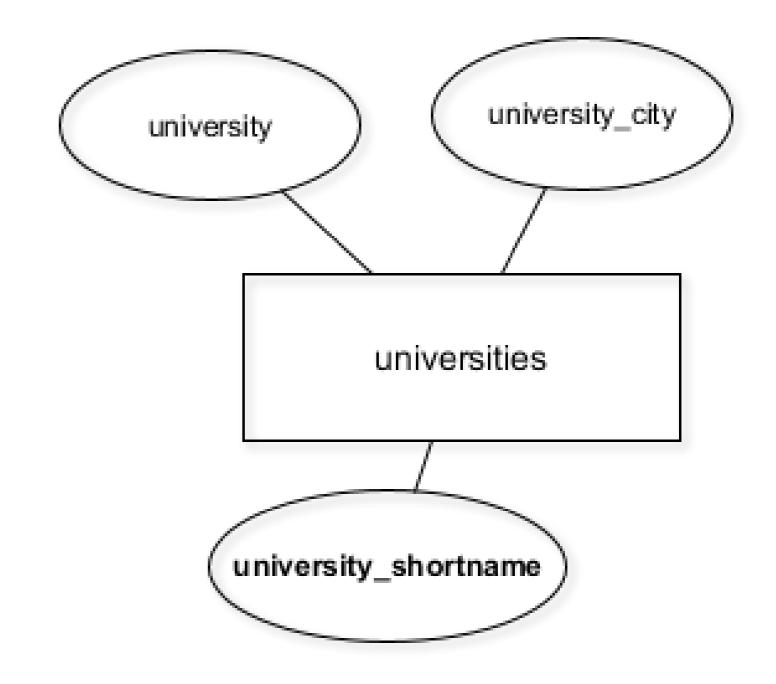

DROP NOT NULL;

```
ALTER COLUMN home_phone
SET NOT NULL;

ALTER TABLE students
ALTER COLUMN ssn
```

The unique constraint

- Disallow duplicate values in a column
- Must hold true for the current state
- Must hold true for any future state

Adding unique constraints

```
CREATE TABLE table_name (
  column_name UNIQUE
);

ALTER TABLE table_name
ADD CONSTRAINT some_name UNIQUE(column_name);
```

Let's apply this to the database!
